Blind System Identification
and Equalization. In early
1990's, we investigated
blind system identification
and equalization. In order
to compensate for channel
distortion, channel
parameters have to be

identified explicitly or implicitly. Blind signal processing estimates channel/system parameters only by means of statistics of the system outputs without using any training sequences.

Geoffrey Ye Li

The absence of training signals from many kinds of transmission necessitates the widespread use of blind equalization and system identification. There have been many algorithms developed for these purposes, working with one- or two-dimensional signals and with single-input single-output or..
