There are two types of cell division called mitosis and meiosis. Mitosis produces identical diploid body cells for growth and repair. Meiosis produces haploid non-identical sex cells, or gametes...

Cell division is the process by which biological cells multiply. There are three major types of cell division: Mitosis - used by Eukaryotic organisms to grow or reproduce asexually; Meiosis - used by Eukaryotic organisms to create sex cells (gametes);

The process takes the form of one DNA replication followed by two successive nuclear and cellular divisions (Meiosis I and Meiosis II). As in mitosis, meiosis is preceded by a process of DNA replication that converts each chromosome into two sister chromatids. Meiosis I. Meiosis I separates the pairs of homologous chromosomes.

In meiosis a cell divides into four cells that have half the number of chromosomes. Reducing the number of chromosomes by half is important for sexual reproduction and provides for genetic diversity. Mitosis Cell Division. Mitosis is how somatic – or non-reproductive cells – divide. Somatic cells make up most of your body's tissues and organs, including skin, muscles, lungs, gut, and hair cells.

Mitosis involves the division of body cells, while meiosis involves the division of sex cells. The division of a cell occurs once in mitosis but twice in meiosis. Two daughter cells are produced after mitosis and cytoplasmic division, while four daughter cells are produced after meiosis.

Mitosis and meiosis both represent cell division that occur in humans and other animals. These cell division processes share many aspects, including the production of new cells and replication of genetic material. But they also have differences in the way they make new cells with different goals and slightly different outcomes.

Cell division for reproduction involves the production of gametes (sex cells). It includes the process of meiosis. Mitosis and meiosis specifically relate the to division of cell nuclei, but they are both immediately followed by division of the whole cell, which is called cytokinesis. Cell division produces

The second meiotic division is where sister (duplicated) chromatids separate. It resembles mitosis of a haploid cell. At the start of the second division, each cell contains  $1N$  chromosomes, each consisting of a pair of sister chromatids joined at the centromere. Here is a simplified diagram illustrating the overall process and products of meiosis:

The cell separates the copied chromosomes to form two full sets (mitosis) and the cell divides into two new cells (cytokinesis). The period between cell divisions is known as 'interphase'. Cells that are not dividing leave the cell cycle and stay in G0.

They are produced by the division processes of mitosis and meiosis. Cell division is the reproductive mechanism whereby living organisms grow, develop, and produce offspring. At the completion of the mitotic cell cycle, a single cell divides forming two daughter cells. A parent cell undergoing meiosis produces four daughter cells.
