Micrite as a component of carbonate rocks can occur as a matrix, as micrite envelopes around allochems or as peloids. Micrite can be generated by chemical precipitation, from disaggregation of peloids, or by micritization. The term was coined in 1959 by Robert Folk for his carbonate rock classification system.

The Dhurma Formation has been assigned a Middle Jurassic age (Bajocian - Bathonian - Callovian) and shows a distinct lateral facies variation where the carbonate rocks in the north are replaced by siliciclastics to the south (Powers et al., 1966).
