In this assignment, you will use the three similar triangles in the diagram to prove that the Pythagorean Theorem works for all triangles. You will no longer have to take the word of others, you will prove it for yourself. First, take the three triangles in the diagram and arrange them so that corresponding sides are lined up.

A short equation, Pythagorean Theorem can be written in the following manner: $a^2 + b^2 = c^2$. In Pythagorean Theorem, c is the triangle 's longest side while b and a make up the other two sides. The longest side of the triangle in the Pythagorean Theorem is referred to as the ' hypotenuse '. Many people ask why Pythagorean Theorem is important.

Euclid was a mathematician from the Greek city of Alexandria who lived during the 4th and 3rd century B.C. and is often referred to as the "father of geometry." Within his foundational treatise "Elements," Euclid presents the results of earlier mathematicians and includes many of his own theories in a systematic, concise book that utilized a brief set of axioms and meticulous proofs to solidify his deductions. In addition to its easily referenced geometry, "Elements" also includes number theory and other mathematical considerations. For centuries, this work was a primary textbook of mathematics, containing the only framework for geometry known by

Mathematicians until the development of "non-Euclidian" geometry in the late 19th century. The extent to which Euclid's "Elements" is of his own original authorship or borrowed from previous scholars is unknown, however despite this fact it was his collation of these basic mathematical principles for which most of the world would come to the study of geometry. Today, Euclid's "Elements" is acknowledged as one of the most influential mathematical texts in history. This volume includes all thirteen books of Euclid's "Elements," is printed on premium acid-free paper, and follows the translation of Thomas Heath.
