Given the transfer function  $H(s)$  and input  $X(s)$ , then  $Y(s)=H(s)X(s)$ . If the input is  $\delta(t)$ , then  $X(s)=1$  and  $Y(s)=H(s)$ . Hence, the physical meaning of  $H(s)$  is in fact the Laplace transform of the impulse response of the corresponding circuit. C.T. Pan26. 12.4 The Transfer Function and the Convolution Integral.

*LAPLACE TRANSFORM AND ITS APPLICATION IN CIRCUIT ANALYSIS*

Laplace Transform . The Laplace Transform is a powerful tool that is very useful in Electrical Engineering. The transform allows equations in the "time domain" to be transformed into an equivalent equation in the Complex S Domain. The Laplace transform is an integral transform, although the reader does not need to have a knowledge of integral calculus because all results will be provided.

Having mastered how to obtain the Laplace transform and its inverse, we are now prepared to employ the Laplace transform to analyze circuits. Laplace Transform Circuit Element Models. This usually involves three steps. Steps in Applying the Laplace Transform: 1. Transform the circuit from the time domain to the s-domain. 2. Solve the circuit using nodal analysis, mesh analysis, source transformation, superposition, or any circuit analysis technique with which we are familiar. 3.
